This task has been designed to give you some experience using the DATE() function. You are literally seizing the ~~day~~ date!

All you need to do is produce suitable code to output the date in the following formats.

Remember...you will need to set your default timezone first!

The first one has been done for you:

1.   Monday 6th April 2015
       echo date('l jS F Y');

2.   Today is Tuesday

3.   Monday 06 April, 2015

4.   2015/04/06   (Year / Month / Day)

5.   Monday 6th April 2015, 3:12 PM

Check if the current year is a leap year. Echo out a suitable message to say if it is or is not.
